There are n applicants and m free apartments. Your task is to distribute the apartments so that as many applicants as possible will get an apartment.

Each applicant has a desired apartment size, and they will accept any apartment whose size is close enough to the desired size.

Input

The first input line has three integers n , m , and k : the number of applicants, the number of apartments, and the maximum allowed difference.

The next line contains n integers a_1, a_2, \dots, a_n : the desired apartment size of each applicant. If the desired size of an applicant is x , he or she will accept any apartment whose size is between $x - k$ and $x + k$.

The last line contains m integers b_1, b_2, \dots, b_m : the size of each apartment.

Output

Print one integer: the number of applicants who will get an apartment.

Constraints

- $1 \leq n, m \leq 2 \cdot 10^5$
- $0 \leq k \leq 10^9$
- $1 \leq a_i, b_i \leq 10^9$

Example

| Input | Output |
|----------------------------------|--------|
| 4 3 5 60 45 80 60 30 60 75 | 2 |
